
CKS : Complete Certification Guide

Exploring Network-Level Security

Cluster Network

- Kubernetes uses a Virtual Cluster Network to allow Pods to communicate with other Pods and services freely, transparently, regardless of on which node they are on.

Cluster Network

- If attacker can communicate Cluster Network from outside. He can communicate with all containers.
- Limit access the Cluster Network from outside the cluster.
- Anyone who can reach the cluster Network can reach the any Pod in cluster.

Thank You...

Don't be the Same! Be Better!!!
